AutoCAD has been installed on over 50 million desktops worldwide. Its estimated user base on the desktop is 20 million. Company Background Autodesk, Inc., is a privately held company based in San Rafael, California. It was founded by John Warnock and a group of three other business graduates in 1968. The company developed its first commercial software in 1974, called STEPS, and by the early 1980s it was a leading provider of engineering and architectural CAD software for the automotive, aerospace, and architecture industries. The company's growth continued, and by the early 1990s it was developing its own products, such as MicroStation, the first software that operated on Apple Macintosh computers. To grow and to create profitable products, Autodesk started developing its own software products, and in the 1990s it released such software applications as 3D Studio, a graphics and animation program; Alias Wavefront, a modeling and texturing program; Draw (originally released as Draw/Re) a 2D and 3D drawing application; 3D Studio Max, a modeling and rendering program; and AEC Modeling and Development, a software application for architecture, engineering, and construction (AEC). In the early 2000s, Autodesk started moving away from the desktop computer into a new business model that offered its software as a subscription service called cloud computing. Autodesk's products were originally subscription-based, and the company focused on the architectural, engineering, and construction industries. It also developed its own products, such as AutoCAD, a desktop product that was created for the desktop computer market. The new cloud computing business model provided a good opportunity for Autodesk to develop products that could help other businesses or industries. Autodesk's Move into the Mobile and Web Business The company first announced its cloud computing business strategy in 2003, and it released its AutoCAD 360 cloud services in 2007. Autodesk released the web-based AutoCAD 360 cloud service in 2011, and the mobile app was released in 2013. AutoCAD 2014 AutoCAD 2014 was introduced in September 2012 as a product replacement for AutoCAD LT, and it was the first major release of AutoCAD since 2006. A new feature of AutoCAD 2014 was a cloud service called Autodesk 360 cloud. Other enhancements included better workflows for roadways, buildings, and a wider variety of drawing styles. The new AutoCAD

Field of the Invention The present invention relates to an image recording method, an image recording apparatus and an image recording medium and, more particularly, to an image recording method and an image recording apparatus by which, when a continuous sheet is used as an image recording medium and image recording is performed on the continuous sheet while a roll of the continuous sheet is supplied, the continuous sheet is cut at the trailing end of a recording area to obtain a recording portion having an appropriate length and, thereafter, the continuous sheet is supplied again, so that the image recording is performed on a new recording area at the leading end of the continuous sheet, and an image recording medium. 2. Related Background Art An image recording apparatus that performs image recording on a continuous sheet by using a recording material (hereinafter referred to as the continuous sheet) in which a plurality of roll-like recording areas are formed in parallel has been widely used. For example, such an image recording apparatus is used in a facsimile apparatus in which recording on both sides of a sheet is enabled, a copying apparatus in which recording on both sides of a sheet is enabled, a digital multi-function peripheral apparatus in which recording on both sides of a sheet is enabled, and the like. By using such an image recording apparatus, when an original document is read by an original document reading apparatus such as a scanner and a picture signal obtained by the reading is sent to an image recording apparatus, the image recording apparatus starts recording on the continuous sheet by using a recording material (hereinafter referred to as the continuous sheet) on which a plurality of the recording areas in which image recording is performed are formed. In this case, when the continuous sheet is held at the trailing end of the recording area and the image recording is started, the continuous sheet is cut at the trailing end of the recording area. The continuous sheet on which the recording area is cut is wound back so that the continuous sheet is always held at the leading end of the continuous sheet. In addition, when the image recording of an original document is completed, the recording area on which the image recording was performed is released, the continuous sheet is moved to the trailing end thereof, and
