What's New in the?

DVDforger is a set of tools which are used to build any DVD. The tools provided come along with DVDforger. You can use them separately without DVDforger or you can use all of them together as if they were part of DVDforger. (There are more tools though which are provided with DVDforger as they could also be useful for other purposes). You can use DVDforger as a GUI for the set of tools listed above. You can simply click on the desired tool to start it, open the desired type of files and let it do the rest. When it finishes you will get an iso file to burn on a DVD. DVDforger can also create a makefile to make life even easier when using these tools. It is a big GUI, but it will never bother you. The application is complex to use and it will be similar to other applications that you have used before. It is not very user-friendly, but it may be easier to get started with than other DVD tools. It is possible to make these tools to work for non-DVD files as well, with some tricks, but I do not recommend it. Don't forget that DVD forger will need to be able to read all the information from your video files. It will not be able to write DVDs on files which are missing data. If you want to experiment with other files, you will need to have a program like PsEdit to read the files so that DVDforger can find the data. DVDforger is available from the DVDforger project site. It can also be used for other purposes. The DVDforger site: Some more information about DVDforger can be found on DVDforger's mailing list or in the FAQ files of this site.
